Professor Steve Watson

Title: A career based on sticking together

I shall summarise the early stages of my career which led me from studying the neural networks of the brain to the platelet and ultimately the dissection of the signalling pathways used by ITAM and related receptors and study of patients with platelet bleeding disorders. This will lead on to the start of the UK Platelet Meetings and Summer Schools, and to other Conference series, and the setting up of the Platelet Charity, and the merger to the UK Platelet Society, and to the future. I shall then return to my current research and my goal of walking over the platelet surface.
